Cause of Seebeck Effect

$$Z = \frac{S^2 \sigma}{k}$$

## Material of choice for thermoelectricity

TE Parameters → Materials ↓		Electrical Conductivity (G) ↑	Seebeck Coefficient (S) ↑	Thermal Conductivity (κ) ↓
Metals	✗	Very High ~ $10^7$ S/m ↑	Low ~ $10 \mu\text{V/K}$ ↓	High ~ $10^2$ W/m-K ↑
Insulators	✗	Extremely low (~ $10^{-10}$ S/m) ↓	High ↑	Low ~ $10^{-2}$ - $10^{-4}$ W/m-K ↓
Semiconductors	✓	Moderate $10^{-3}$ S/m ↑	High ~ $120 \mu\text{V/K}$ ↑	Low ~ $10$ W/m-K ↓

Semiconductors most suitable TE material.  
Allow separate control of G (electrons) and  $\kappa$  (phonons).

Power output

Question 1. A thermal electric generator has the following properties

S.No	Properties	Material A	Material B
1	Seebeck Coefficient	$- 190 \times 10^{-6}$	$- 190 \times 10^{-6}$
2	Specific resistivity (ohm-cm)	$1.45 \times 10^{-3}$	$1.8 \times 10^{-3}$
3	Figure of Merit (z)	$2 \times 10^{-3}$	$1.7 \times 10^{-3}$
4	Cross-sectional Area	1	1.14
5	Length of Leg (cm)	1	1

Calculate thermal conductivity of each semiconductor and also the total resistance of both the semiconductor.

A thermoelectric generator with dimensions and properties given in previous example operated between the temperature Limits of 100 C and 300 C. Using the optimum value for the product of internal resistance and overall conductance, calculate the maximum generator efficiency for maxi. power. Further, calculate the power output for both the cases.
